EDUCATION

Rutgers University **Sep 2022 – Dec 2026**

Bachelor of Science in Computer Science *New Brunswick, NJ*

Coursework: OS Design, Internet Technology, Computer Security, Systems Programming, Computer Architecture

SKILLS

Systems: Proxmox VE, LXC, Debian, Arch, Docker, systemd
Networking: DNS, DHCP, SMTP/IMAP, pfSense, Linux bridges, Tailscale, SSH, Wireshark, Nmap
Hardware: PCIe GPU passthrough, PCIe KVM, SPI flash programming (CH341A, flashrom), ESP32, 3D printing
DevOps & Languages: Git/GitHub, Vercel, Railway, Supabase, Coolify, VPS admin, Bash, SQL

EXPERIENCE

Appenza **Jul 2026 – Aug 2026**

Intern *Egypt*

- Built and deployed a voice-first executive assistant for a client office on a VPS I administered (Coolify, Docker), reachable only over Tailscale, which I set up on the client's laptop.
- Became the client office's go-to IT contact, installing software and fixing issues; an MX lookup I ran led to working with their IT team to move the domain's mail off Hostinger.

RUSLUG – Rutgers Student Linux User Group **Sep 2026 – Present**

Vice President *New Brunswick, NJ*

- Present on Linux and open source; walk members through the shell, Bash and core command-line tools.
- Troubleshoot peers' Linux installs and desktop environments; help run install fests and ricing competitions.
- Demo new distributions live as VMs on my homelab so members can try them without installing anything.

Wythe Windows, Inc **May 2023 – Aug 2024**

Manufacturing Associate *Ramsey, NJ*

- Worked fabrication, assembly and glazing to standard procedures; tore down and reworked finished units to fix defects.

PROJECTS

Homelab: Virtual Enterprise Network | *Proxmox VE, Active Directory, pfSense, Splunk* **Dec 2025 – Present**

- Run Proxmox VE on bare metal: 8 VMs and 4 LXC containers on one node, segmented from my home LAN by pfSense.
- Built an AD domain on Windows Server 2022 (AD DS, DNS, DHCP) with a Windows 11 client under Group Policy.
- Centralized Windows logs in Splunk (Forwarders, Sysmon) and detected my own Nmap and LLMNR attacks from Kali.
- Set up PCIe GPU passthrough to a remote Arch desktop VM, debugging across hardware, hypervisor and guest OS.
- Added a PCIe KVM card for out-of-band console and power control; remote access is Tailscale-only, no open ports.

Enterprise-Locked Chromebox Recovery | *SPI Flash, CH341A, coreboot, Debian* **Oct 2026**

- Ruled out a drive swap and CMOS reset, then traced an enterprise enrollment lock to the board's SPI flash chip.
- Removed write protection, backed up factory firmware via a CH341A programmer, then flashed and verified coreboot.
- Installed Debian 13; it now runs headless over Tailscale SSH as the always-on server for DJWYA's scheduled jobs.

DJWYA.live: Festival Discovery Platform | *Next.js, FastAPI, Docker, Supabase, Vercel* **Feb 2026 – Present**

- Run it solo: Next.js on Vercel, Dockerized FastAPI on Railway, Supabase Postgres, and scrapers on the Chromebox.
- Designed a 7-axis "Sonic DNA" model and a ranking engine mixing cosine similarity, distance decay and BM25.
- Built an artist-classification pipeline on the Last.fm API with key rotation and a parent/child genre graph.
- Automated lineup ingestion with scrapers that extract lineups from festival sites and posters into Postgres.
- Shipped a D3 genre network graph, a Leaflet festival map, and group matching for 2–8 friends.
